Source context supports an extracted assertion

Source unit: Wyoming - Climate

The southeastern corner of the state is the most vulnerable part of the state to tornado activity.

Moving away from that point and westwards, the incidence of tornadoes drops dramatically with the west part of the state showing little vulnerability. Tornadoes, where they occur, tend to be small and brief, unlike some of those that occur farther east.

extraction

span location

Extracted five-field assertion

Subject: southeastern corner of the state

Object: tornado vulnerability

Mechanism: Most vulnerable to tornadoes; incidence drops dramatically moving west

Conditions: Where they occur

Consequences: Tornadoes tend to be small and brief, unlike some farther east

Located witness

"The southeastern corner of the state is the most vulnerable part of the state to tornado activity."

Witness support: southeastern vulnerability. Full assertion support: the three-sentence source.

Additional support from context

The second and third source sentences supply those additional claims. The source section identifies the state as Wyoming.
